This sequence represents Erwinia herbicola phytoene dehydrogenase4H encoded by DNA from the plasmid pARC376. Phytoene dehydrogenase-4H has a encoded by DNA from the plasmid pARC376. Phytoene dehydrogenase-4H has a molified by DNA from the structural gene, presuming an average amino acid residue of about 109 the structural gene, presuming an average amino acid residue of about 109. The native phytoene dehydrogenase-4H gene is located between positions 749 and 6380 of plasmid pARC376. Phytoene check parcentage which is involved in the biosynthesis of carotenoids, esp. lycopene, from the ubiquitous precursor, farnesyl prophosphate. In E. herbicola, phytoene has been found to be formed pisophosphate. In E. herbicola, phytoene has been found to be formed prophosphate in E. herbicola, phytoene has been found to be formed prophosphate in a two-step process. The initial step is the condensation of farnesyl pyrophosphate (FPP) and isopentyl pyrophosphate (FPP) and isopentyl pyrophosphate is produced from phytoene synthese, to form phytoene is produced from phytoene by the catalysed by the enzyme phytoene by the catalysed by the surface proponents of the lycopene is produced from phytoene by the catalytic action of phytoene commercial production of lycopene which is used as a food colourant.

Thanks transformed with the phytoene dehydrogenase-4H coding sequence protected from the herbicide norfluxacon. (Updated on 25-MAR-2003 to correct PF field.) Phytoene_dehydrogenase-4H from pARC146D

```
A novel DNA molecule has been isolated which encodes an Erwinia herbicola lycopene cyclase enzyme that converts lycopene to beta-carotene. The DNA molecule comprises at 1825 bp and is present in the plasmids pARC1510, pARC1510. The present in the plasmids the amino acid sequence corresponding to the structural gene for phytoene dehygrogenase-4H. The new DNA molecule can be used to produce the recombinant enzyme and transgenic organisms, e.g. yeasts or plants, with increased beta-carotene levels. Beta-carotene is used as a colourant in margarine and butter and as an intermediate for vitamin A, and may prevent cancer. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                   DNA encoding Erwinia herbicola lycopene cyclase - for producing recombinant enzyme, and transgenic organisms with increased beta-carotene
                                                                                                                                                                                                                                                                                                                           Example 10; Fig 11; 102pp; English

```
coli cells to produce GGPP and the carotennoids phytocene through zeaxanthin diglucoside, which is the final prod. identified in the carotennoid pathway contd. in plasmid pARG376 (contg. a ca. 13 Kb chromosomal DNA fragment isolated by Perry et al., d. Bacteriol., i68:607 (1986). The genes for geranylgaranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene dehydrogenase-4H, lycopene cyclase, beta-carotene hydroxylase, and zeaxanthin glycosylase are represented in AAQ13116, AAQ13118, AAQ13722, AAQ13724 and AAQ13726 beta-respectively. Recombinant expression plasmids can be used to produce large ants. of the enzymes and hence large ants. of the carotennids which they synthesise. Carotennids are pigments with a variety of applications. (Updated on 25-MAR-2003 to correct PP field.) (Updated on 25-MAR-2003 to correct PP field.) (Updated on 25-MAR-2003 to correct PP field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SAIBELFALAGKQLKDYVELLEVTPFYRLCWESGKVFNYDNDQAQLEAQIQQFNPRDVAG 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      There are a total of six relevant genes in a 7900 bp region that cause B. coli cells to produce GGPP and the carotenoids phytoene through careamenthin diglucoside, which is the final prod. identified in the carotenoid pathway contd. in plasmid pRAC376 (contg. a ca. 13 kb chromosomal DNA fragment isolated by Perry et al., J. Bacteriol., 168:607 (1986). The genes for geranylgeranyl pyrophosphate (GGPP) synthase, phytoene synthase, phytoene dehydrogenase-44, lycopene cyclase, betacarotene hydroxylase, and zeaxanthin glycosylase are represented in AAQ13712, AAQ13712, AAQ13722, AAQ13722, and AAQ13722 house are represented in respectively. Recombinant expression plasmids can be used to produce large amts. of the enzymes and hence large amts. of the carotenoids which they synthesise. Carotenoids are pigments with a variety of applications. (Updated on 25-WAR-2003 to correct PF field.) (Updated on 25-WAR-2003 to correct PP field.) (Updated on 25-WAR-2003 to correct PP field.)

Proffitt J, Mukharji I, Yarger J; Brinkhaus FL,

N-PSDB; AAT40793

Increasing prodn. of total carotenoid(s) in a higher plant - by transforming with vector encoding chloroplast transit peptide operably linked to the Erwinia herbicola lycopene cyclase structural gene.

Example 12; Col 97-100; 99pp; English

The present sequence is that of a recombinant Brwinia herbicola phytoene dehydrogenase-4H (from pARC146D) which produces lycopene biosynthetically from phytoene through four sequential dehydrogenation reactions. Other enzymes involved in the carotemold biosynthesis pathway include geranylgeranyl pyrophosphate (AAW0119), phytoene synthase (W0121) and lycopene cyclase (AAW01125). Manipulation of, in partic., lycopene cyclase (AAW0124) by in frame linkage to the chloroplast transit peptide (AAW0124) of the tobacco ribulose bis-phosphate carboxylase-oxygenase gene (AAW0124) of the tobacco ribulose bis-phosphate carboxylase-oxygenase gene can lead to increased production of total carotemoids in the chloroplast of transformed plants as compared to native, nontransformed plants of the same type. Beta-carotene is an effective and apparently harmless food colourant and is also in the pathway for biological synthesia of further cqu carotemoids such as zeaxanthin and zeaxanthin diglucoside (Updated on 25-MM8-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise OS field)

-i- PATHWAY: Carotenenid biosynthesis.
-i- SUBCELLULAR LOCATION: Chloroplast.
-i- SIMILARITY: Belongs to the lycopene cyclase family.
